| Formel                   | C21H25NO3 HCl                                                                                                                                                                                                                                                                                                                                |
| Anwendungsbeschreibung   | Opioid antagonist. Very similar activity profile to naloxone however displays slower onset and longer duration of action <sup>1</sup> . Antagonizes the effects of salvinorin <sup>2</sup> (kappa-agonist) as well as herkinorin <sup>3</sup> (μ-agonist). Has been used as a therapeutic for treatment of alcohol dependence <sup>4</sup> . |
