Anwendungsbeschreibung	FSG67 is an inhibitor of Glycerol 3-Phosphate Acyltransferase (GPAT), $IC_{50} = 24 \mu M$.¹ It was able to reduce food intake, decrease body weight and adiposity, enhance energy utilization as fatty acid oxidation, reverse hepatic steatosis, and enhance insulin sensitivity in diet-induced obese mice while showing no in vitro or in vivo toxicity.² FSG67 also caused decreased gene expression for orexigenic hypothalamic neuropeptides AgRP and NPY.² FSG67 increased FAOx in primary hypothalamic neurons (PHN) leading to an increase in ATP and inactivation of AMPK. Oxidative stress and indicators of ER stress were also reduced in PHN.³
