Anwendungsbeschreibung	Motolimod (926927-61-9) is a selective Toll-like receptor 8 (TLR8) agonist (EC50 = 100 nM). It stimulates the production of TNFalpha and IL-12 from monocytes and myeloid dendritic cells. Motolimod also stimulated IFNgamma production from NK cells and increased their toxicity against K562 and ADCC by rituximab and trastuzumab.^{1,2} It induced apoptosis in monocytic myeloid-derived suppressor cells.³ Motolimod is being investigated in combination with other cancer immunotherapies.^{4,5} Motolimod has also been shown to induce secreted IL-1b and IL-8 via activation of the NLRP3 inflammasome.⁶
